                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                New antisense nucleic acids, useful for identifying proteins or scretor homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              drug discovery programs, or for screening homologous nucleic at required for proliferation in cells other than S. aureus, S. t) K. pneumoniae or P. aeruginosa. The present sequence is encoded that arget prokaryotic essential genes. Note: The sequence date patent did not form part of the printed specification, but was in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              0;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          group B streptococcus; Streptococcus treptococcus pyogenes; antibacterial; ion; vaccine; meningitis; gene therapy

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. (I) A composition comprising (I) or a nucleic acid encoding (I), may be biological sample. (I) is used to determine whether a compound binds to biological sample. (I) is used to determine whether a compound binds to used as a vaccine or diagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                  or
                                                                                                                                                                             infection, and for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     design
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     drug
                                                                                        ပ်
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ·.
                                                                                                                                                                               New Streptococcus protein for the treatment or prevention of disease caused by Streptococcus bacteria, such as meningitis, detecting a compound that binds to the protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Antisense; prokaryotic essential gene; cell proliferation;

The invention relates to an isolated nucleic acid comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are of the nucleic acid inhibits proliferation of a cell. Also included are coff the nucleic acid inhibits proliferation of a cell. Also included are encoding a polypeptide whose expression is inhibited by the antisense concleic acid; (4) an exter concern; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense concleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular concernse proliferation or the activity of a gene in an operon required for proliferation or that has an activity against a biological pathway concerns for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product is organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying an expension. The antisense nucleic acids are useful for proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for proliferation in cislate candidate molecules for retional crudical provers or collection in cells other than S. aureus, S. typhimurium, T. P. Parger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     by one of

the folly antisense to an isolateu nucleic acid comprising any one of the mucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid;
(2) a host cell containing the vector; (3) an isolated are:

(1) a vector comprising a promoter operably linked to the nucleic acid;
(2) a host cell containing the vector; (3) an isolated artisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway contained for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotis; (10) profiling a compound, a activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational changing accepting or to a for screening homologous nucleic acide required for any discoverty programs, or for screening homologous nucleic acide acide action of an organism. The antisense molecules acide acide action of an organism acts; (11) accepting nucleic acide acide action of an organism acts; (11) accepting acceptin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    by one of

promoter functions are recombinant DNA construct comprising a promoter functional in a plant pell, where the promoter is positioned to promoter functional in a plant pell, where the promoter is positioned to converte for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant. DNA construct and a method of producing a craps plant countries and property. The plant is a crop plant comprised property comprises transforming a plant with the having an improved property comprises transforming a plant with the combinant DNA construct and growing the transformed plant where the polymucleotide or polypeptide is useful for improving plants with improved plant properties, e.g. improved cold, heat or drought tolerance.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance.

The resistance to harbicides, extreme osmotic conditions, pathogens or pests, or or existance to plant disease, better growth rate by modification of carbohydrate, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved plant growth and development under at least one stress providing improved plant growth and development under at least one stress condition, improved plant growth and development of photosynthesis or by production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not format from mean transferment from mean from mean format from mean from the promoted of the growth recombined by the growth recombined by the printed specification of the growth format for the sequence data for this patent did not format from the properties of the properties of the plant growth recombined by the plant growth reco

The present invention relates to novel Streptococcus agalactiae
nucleotide sequences (1; ADV87607-ADV87745) and novel polypeptides of S.
ADV87746-ADV89950). The nucleotide sequences encode polypeptides of S.
cagalactiae involved in the synthesis of amino acids, cell membranes,
intermediate (central) metabolism, energetic metabolism, fatty acid and
phospholipid metabolism, nucleotide metabolism including purines,
pyrimidines and/or nucleosides, regulatory functions, replication,
conditions, sensitivity to medicines and/or analogues, functions related
to transposons, biosynthesis of cofactors, prosthetic groups and
transporters, cell membrane proteins and cellular machinery. (I) are
useful for the detection and/or amplification of nucleic acids.
Charmaceutical composition comprising (I) or (II) are useful for
treatment of a bacterial S. agalactiae infection. Note: WO200292818A2
contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     related
                                                                                                                                                                                                                                                                                                                                                                                                                   nucleotide sequences encoding polypeptides of Streptococcus
iae for the development of vaccines, diagnostic tools, DNA chips
atification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                   uncleotide sequences (1; ADV78860-ADV78998 and ADV83341-ADV85476) and nucleotide sequences (1; ADV78899-ADV81203 and ADV83341-ADV85476) and nucleotide sequences (1; ADV78999-ADV81203 and ADV81205-ADV83340). The nucleotide sequences encode polypeptides of S. agalactia involved in the synthesis of amino acids, cell membranes, intermediate (central) conclectide metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and collular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactiae infection. The complete genome of Streptococcus agalactiae is given in ADV81204. Note: The contains only 2344 sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                    Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chipand identification of therapeutic targets.

The present invention relates to novel Streptococcus agalactiae nucleotide sequences (I; ADV78860-ADV78998 and ADV83341-ADV85476) and novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The nucleotide sequences encode polypeptides of S. agalactiae involved in the synthesis of amino acids, cell membranes, intermediate (central) metabolism, energetic metabolism, fatty acid and phospholipid metabolism, nucleotide metabolism including purines, pyrimidines and/or nucleosides, regulatory functions, replication, transcription, translation, protein transport, adaptation to atypical conditions, sensitivity to medicines and/or analogues, functions related to transposons, biosynthesis of cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or analogues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cofactors, prosthetic groups and transporters, cell membrane proteins and cellular machinery. (I) are useful for the detection and/or amplification of nucleic acids. Pharmaceutical composition comprising (I) or (II) are useful for treatment of a bacterial S. agalactiae infection. The complete genome of Streptococcus agalactiae is given in ADV81204. Note: The present patent is an equivalent for the basic patent FR2824074Al, which contains only 2344 sequences.
                                                                                                                                                                                                                                                                                                      Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                      Kunst

The invention relates to an isolated nucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide having Enterococcus faecium encoding an Enterococcus faecium polypeptide having cone of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and a single-stranded probe comprising the nucleic acid The nucleic acids are chosen from 3654 disclosed sequences encoding 3654 disclosed proteins. The nucleic acids is useful for diagnosing pathological conditions infection, bacteraemia, endocarditis, wounds and abdominal-pelvic infection) and for screening drugs such as agonists and antagonists. The nucleic acid is useful for recombinant production of Candida albicans derived peptides or antisense polypeptides. Pharmaceutical compositions and vaccines containing the nucleic acid are useful for preventing or treating Enterococcus faecium infections. The present sequence represents cone if the disclosed E. faecium proteins.

Nature 406, 959-964, 2000
A; Title: Complete genome sequence of Pseudomonas aeruginosa PAO1,
A; Reference number: A82950; MUID:20437337; PMID:10984043
A; Accession: E83497
A; Status: preliminary
A; Molecule type: DNA
A; Residues: 1-472 <STO>
A; Experimental source: strain PAO1
C; Genetics:
A; Gene: PA1194
C; Superfamily: ecotropic retrovirus receptor protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              475;

US-09-543-681A-7620

Sequence 7620, Application US/09543681A

Patent No. 6605709

GENERAL INFORMATION:

TITLE OF INVENTION: NUCLEIC ACID AND AMINO ACID SEQUENCES RELATING

TITLE OF INVENTION: DIAGNOSTICS AND THERAPEUTICS

FILE REFERENCE: 2709.1002-001

CURRENT APPLICATION NUMBER: US/09/543,681A

CURRENT FILING DATE: 2000-04-05

PRIOR APPLICATION NUMBER: US 60/128,706

PRIOR FILING DATE: 1999-04-09
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

US-11-087-099-9097
; Sequence 9097, Application US/11087099
; Publication No. US20060041961A1
; GENERAL INFORMATION:
; APPLICANT: Abad, Mark S. et al.
; TITLE OF INVENTION: Genes and Uses for Plant Improvement
; FILE REFERENCE: 38-21(53450)B EP
; CURRENT APPLICATION NUMBER: US/11/087,099
; CURRENT FILING DATE: 2005-03-22
; NUMBER OF SEQ ID NOS: 12464
; SEQ ID NO 9097
; LENGTH: 491
; TYPE: PRT
; ORGANISM: Pseudomonas fluorescens PfO-1

the of Novel peptides capable of binding Rhesus D antibodies are used to manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. hemolytic disease newborn (HDN).

12; 19pp; English. Page ٦; Claim

more The present sequence represents a peptide capable of binding Rhesus D antibodies (I). Also described in the present invention are: (1) a nucleic acid (II) encoding (I); (2) a vector (III) comprising one or more (II) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) peptides having immunologic properties of Rhesus D protein epitopes comprising subjecting an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage display library, and identifying immunogenic peptide sequences which are

ase of the is used to of antibodies purified tions. Using (I) as using immunisation the amino acid immunological ssion of mimotopes which differ in their amino acid sequence from the amino ac sequences of Rhesus D protein; and (6) peptides (V) with immunologics properties of Rhesus D protein epitopes obtained by (M1). (I) is used manufacture an agent for the diagnosis, therapy or prophylaxis of diseases associated with Rhesus D antigen, e.g. haemolytic disease of newborn (HDN) or idiopathic thrombocytopaenic purpura (ITP), for the manufacture of an affinity reagent for anti-Rhesus D antibodies purif or removed from body fluids or immunoglobulin preparations. Using (I) an immunogen to raise anti-Rhesus D antibodies avoids using immunisat with foreign erythrocytes thereby avoiding the risk of transmission o viral diseases like AIDS and hepatitis B Gaps ö Length 10 Indels 3, 4, DB 12; Mismatches Score 34; Pred. the oŧ to of se Novel peptides capable of binding Rhesus D antibodies are used manufacture an agent for the diagnosis, therapy or prophylaxis diseases associated with Rhesus D antigen, e.g. hemolytic diseasesnewborn (HDN).

Example 1; Page 8; 19pp; English.

more e or (IV) The present invention describes peptides capable of binding Rhesus D antibodies (I). Also described in the present invention are: (1) a nucleic acid (II) encoding (I); (2) a vector (III) comprising one or (II) operably linked to an expression control system; (3) a cell (IV) comprising (II) or (III); (4) preparing (I); (5) identifying (M1) peptides having immunologic properties of Rhesus D protein epitopes comprising subjecting an antibody/antibody fragment recognising an epitope of Rhesus D protein to several panning rounds with a phage 

display library, and identifying immunogenic peptide sequences which are mimotopes which differ in their amino acid sequence from the amino acid sequences of Rhesus D protein; and (6) peptides (V) with immunological properties of Rhesus D protein epitopes obtained by (M1). (I) is used to manufacture an agent for the diagnosis, therapy or prophylaxis of elementacture an agent for the diagnosis, therapy or prophylaxis of the newborn (HDN) or idiopathic thrombocytopaenic purpura (ITP), for the manufacture of an affinity reagent for anti-Rhesus D antibodies purified or removed from body fluids or immunoglobulin preparations. Using (I) as an immunogen to raise anti-Rhesus D antibodies avoids using immunisation with foreign erythrocytes thereby avoiding the risk of transmission of viral diseases like AIDS and hepatitis B. The present sequence represents an anti-Rhesus D (RhD) antibody related peptide which is used in an example from the present invention

New polypeptides derived from Streptococcus agalactiae are useful to provide detection of, and vaccination against, Group B Streptococcus infections, particularly to prevent infection in neonatals.

Fig 1; 178pp; English Claim 1;

AAU03601-AAU03722 represent Group B Streptococcus (Streptococcus agalactiae) amino acid sequences of the invention. S. agalactiae is an encapsulated bacterium which is a major pathogen of humans causing sepsis and meningitis in neonates as well as adults. The S. agalactiae antigenic polypeptides are used to vaccinate against Group B Streptococcus infections, particularly to prevent infection in new born children arising from the maternal genital tract. An immunogenic composition is useful in the preparation of a medicament for the treatment or prophylaxis of Group B Streptococcus infection. The invention does not have the disadvantages of varied response rate associated with prior art

strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant is a crop plant

cuch as maize or soybean. The method of producing a transformed plant having an improved property comprises transforming a plant with the recombinant DNA construct and growing the transformed plant, where the polynucleotide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plant properties.

The recombinant DNA construct is useful for producing plants with improved plant properties, e.g. improved cold, heat or drought tolerance, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of homologous recombination, modified seed oil or protein yield and/or content, improved yield by modification of carbohydrate, nitrogen or phosphorus use and/or uptake, by modification of photosynthesis or by providing improved plant growth and development under at least one stress condition, improved lignin production or improved galactomannan production. This sequence represents a bacterial polypeptide used in the scope of the invention. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.html.

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide, (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation or the activity of enclosed or that influences the activity of identifying a compound that influences the activity of equipment of the proliferation, or that inhibits cellular proliferation; (8) identifying a gene required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profilling a compound,'s activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent proliferation of an organism, or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for for erlular proliferation to an organism. The antisense nucleic acids required for erlular proliferation of an organism. The antisense molecules for rational and also accenting for homologous nucleic acids required the acids and action of an organism.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhin K. pneumoniae or P. aeruginosa. The present sequence is encoded by the target prokaryotic essential genes. Note: The sequence data for patent did not form part of the printed specification, but was obtain electronic format directly from WIPO at
          New antisense nucleic acids, useful for identifying proteins or tor homologous nucleic acids required for cellular proliferation isolate candidate molecules for rational drug discovery programs

The invention relates to a protein (ABP25413-ABP30895) from group B streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in (Streptococcus pyogenes), comprising one of 5483 sequences (S1), given in a cativity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and activity. (I), nucleic acids encoding (I), are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. (I) sused to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to biological sample. (I) is used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be acid encoding (I) may be used to recombinantly produce (I) and may be used in gene therapy. Antibodies to (I) are used for affinity chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 design.
                                                                                                                                                        infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                   and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene; cell proliferation; drug

The invention relates to an isolated nucleic acid comprising any one of the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for proliferation, or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required gene or its gene product lies or agene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of the strains is present in a culture or collection of the strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids are useful for identifying proteins or screening for homologous nucleic acids required for a compound received or rational drug discovery programs or for arreaning for homologous nucleic acids required for a continue or cellular proliferation of an organism or for arreaning for homologous nucleic acids required for a continue or cellular proliferation of an organism or for arreaning for monologues or acids required for a continue or cellular proliferation or for arreaning for monologues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

The invention relates to an isolated nucleic acid comprising any one of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid cencoding a polypeptide whose expression is inhibited by the antisense conclude or its fragment whose expression is inhibited by the antisense conclude or its fragment whose expression is inhibited by the antisense conclude or its fragment whose expression is inhibited by the antisense nucleic acid, (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular proliferation or the activity of agene in an operon required for the activity of agene in an operon required for proliferation, or that inhibites cellular proliferation; (7) identifying a gene frequired gene or its gene product lies or a gene or which a proliferation or the biological identifying a gene required for cellular proliferation or the biological corporation, or that inhibites proliferation of an organism acts, (9) manufacturing an antibiotic, (10) profilling a compound's activity, (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the extent compound that inhibite proliferation of an organism. The antisense nucleic acids are useful for strains; or (13) identifying the target of a compound that inhibite the corpoliferation of an organism. The antisense nucleic acids are useful for cellular proliferation in cells other than S. aureus, S. typhimurium, chard discovery programs, or for screening for homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, charent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                       useful for identifying proteins or screening required for cellular proliferation to for rational drug discovery programs.

The invention relates to a recombinant DNA construct comprising a promoter functional in a plant cell, where the promoter is positioned to provide for expression of a polynucleotide encoding a polypeptide from a microbial source. The invention also relates to a transformed plant comprising the recombinant DNA construct and a method of producing a transformed plant having an improved property. The plant is a crop plant such as maize or soybean. The method of producing a transformed plant having an improved property comprises transformed plant, where the polymelectide or polypeptide is useful for improving plant properties.

The recombinant DNA construct is useful for improving plants with improved plant properties, e.g. improved cold, heat or aforought tolerance, improved plant properties, extreme osmotic conditions, pathogens or pests, tolerance to herbicides, extreme osmotic conditions, pathogens or pests, increased resistance to plant disease, better growth rate by modification of the cell cycle pathway with plant growth regulators, increased rate of content, improved plant growth and development under at least one stress condition, improved lignin production of photosynthesis or by providing improved lignin production or improved galactomannan contition, improved lignin production or improved galactomannan contition, improved lignin production or improved galactomannan production. Note: The sequence data for this patent did not form part of the printed specification but was obtained in electronic format from USPTO at sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NA construct comprising a promoter positioned to prova

The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (I; ADV87607-ADV87745) and novel polypeptides of S.
ADV87746-ADV89950). The nucleotide sequences encode polypeptides of S.
agalactiae involved in the synthesis of amino acids, cell membranes,
intermediate (central) metabolism, energetic metabolism, fatty acid and
phospholipid metabolism, nucleotide metabolism including purines,
pyrimidines and/or nucleosides, regulatory functions, replication,
transcription, translation, protein transport, adaptation to atypical
conditions, sensitivity to medicines and/or analogues, functions related
to transposons, biosynthesis of cofactors, prosthetic groups and
transporters, cell membrane proteins and cellular machinery. (I) are
useful for the detection and/or amplification of nucleic acids.
Pharmaceutical composition comprising (I) or (II) are useful for
treatment of a bacterial S. agalactiae infection. Note: WO200292818A2
contains 6617 sequence whereas the present patent only contains 2344
                                                                                                                                                                                                                                                                                                                                                                                                                            related
                                                                                                                                                                                                Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                               and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (I; ADV78860-ADV7898 and ADV81205-ADV85476) and
novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The
nucleotide sequences encode polypeptides of S. agalactiae involved in the
synthesis of amino acids, cell membranes, intermediate (central)
metabolism, energetic metabolism, fatty acid and phospholipid metabolism,
nucleotide metabolism including purines, pyrimidines and/or nucleosides,
regulatory functions, replication, transcription, translation, protein
transport, adaptation to atypical conditions, sensitivity to medicines
and/or analogues, functions related to transposons, biosynthesis of
cofactors, prosthetic groups and transporters, cell membrane proteins and
cofactors, prosthetic groups and transporters, cell membrane proteins and
cofactors, prosthetic groups and transporters, cell membrane proteins and
cofactors, prosthetic groups and transporters, cell membrane proteins

The present invention relates to novel Streptococcus agalactiae

nucleotide sequences (I; ADV78860-ADV78998 and ADV83341-ADV85476) and
novel polypeptides (II; ADV78999-ADV81203 and ADV81205-ADV83340). The
nucleotide sequences encode polypeptides of S. agalactiae involved in the
synthesis of amino acids, cell membranes, intermediate (central)
metabolism, energetic metabolism, fatty acid and phospholipid metabolism,
concleotide metabolism including purines, pyrimidines and/or nucleosides,
regulatory functions, replication, transcription, translation, protein
cand/or analogues, functions related to transposons, biosynthesis of
coffactors, prosthetic groups and transporters, cell membrane proteins and
cellular machinery. (I) are useful for the detection and/or amplification
of nucleic acids. Pharmaceutical composition comprising (I) or (II) are
useful for treatment of a bacterial S. agalactiae infection. The complete
genome of Streptococcus agalactiae is given in ADV81204. Note: The
present patent is an equivalent for the basic patent FR2824074A1, which
contains only 2344 sequences.
                                                                                                                                                                                    Genomic nucleotide sequences encoding polypeptides of Streptococcus agalactiae for the development of vaccines, diagnostic tools, DNA chips and identification of therapeutic targets.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine; urinary tract infection; bacteraemia; endocarditis; wound; abdominal-pelvic infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                             The invention relates to an isolated nucleic acid derived from Enterococcus faecium encoding an Enterococcus faecium polypeptide one of 10 fully defined sequences given in the (or comprising 40 sequential nucleotides chosen from any of the nucleic acids, its complement or sequences hybridising to it). Also included are a recombinant vector comprising the nucleic acid operably linked to transcription regulatory element, a cell comprising the vector and single-stranded probe comprising the nucleic acid. The nucleic acids is useful for diagnosing pathological conditions regulting from E. faecium bacterial infection (e.g. urinary tract infection) and for screening drugs such as agonists and antagonist nucleic acid is useful for recombinant production of Candida albic derived peptides or antisense polypeptides. Pharmaceutical compositand vaccines containing the nucleic acid are useful for preventing treating Enterococcus faecium infections. The présent sequence reptone if the disclosed E. faecium proteins.
                                                                                                                                          New isolated nucleic acid derived from Enterococcus faecium end
